

I'm not a robot

If you use an email provider like iCloud, Google, Microsoft Exchange, or Yahoo, Mail can automatically set up your email account with just your email address and password. Here's how: Go to Settings > Apps > Mail, then tap Mail Accounts. Tap Add Account, then select your email provider. Enter your email address and password. If you see Next, tap Next and wait for Mail to verify your account. If you see Save, tap Save. Learn which listed email provider matches your email account. If you need to set up your email account manually, make sure that you know the email settings for your account. If you don't know them, you can look them up or contact your email provider. Then follow these steps: Go to Settings > Apps > Mail, then tap Mail Accounts. Tap Add Account, tap Other, then tap Add Mail Account. Enter your name, email address, password, and a description for your account. Tap Next. Mail will try to find the email settings and finish your account setup. If Mail finds your email settings, tap Done to complete your account setup. If Mail can't find your email settings, then you need to enter them manually. Tap Next, then follow these steps: Choose IMAP or POP for your new account. If you aren't sure which one to choose, contact your email provider. Enter the information for Incoming Mail Server and Outgoing Mail Server. Then tap Next. If you don't have this information, contact your email provider. If your email settings are correct, tap Save to finish. If the email settings are incorrect, you'll be asked to edit them. If you still can't set up your email account or save your email settings, contact your email provider. Thanks for your feedback. mweb.co.za provides IMAP access to your mweb.co.za account, so you can connect to your emails from your desktop email program or your mobile mail app. Posted November 01, 2022 - Updated May 26, 2025 iPhone Really struggling to setup an Mweb mail address in my iPhone (X) mail (outlook app has same issue). Cannot send mail, it leaves then I get a prompt that the server did not recognise one of the recipients email addresses and moves it to my outbox. Have tried many different settings, turned off ssl, and domain names user and password are definitely correct anyone had this problem? I have many friends with Mweb accounts and iPhones that haven't had any issues. thanks [ ] iPhone XR, iOS 16 Posted on Nov 22, 2023 9:32 AM Reply Page content loaded Nov 22, 2023 9:34 AM in response to AJSAA076 Check with your email provider to ensure that you have all of the settings correct for their account. That error sounds like a security issue. This thread has been closed by the system or the community team. You may vote for any posts you find helpful, or search the Community for additional answers. Mweb mail issues outgoing mail iPhone iPhone I signed up for something where I will get an email from them when a certain offer comes up. The problem is, however, I get a lot of spam on my email address, so I turned off notifications for email except for my VIPs. The other problem is that I don't know what the email address is that they will use to send me it. For example, I know that it's coming from gmail.com, but I don't know what is before the @ in \_\_\_\_@gmail.com. I want to know if it's possible for me to add \_\_\_\_\_.com to my VIP list by only adding the domain. Thanks in advance! iPhone 5s, iOS 9.3.2, null Posted on May 30, 2016 12:09 PM Reply Page content loaded May 30, 2016 1:09 PM in response to AppleCurious123 You are talking about setting up a rule - you can do that on web portal of the email provider May 30, 2016 2:09 PM in response to AppleCurious123 You would have to connect with the entity that provides the hosting for the domain. Or your internet service provider. Each one is different - this image is of course from Outlook - but it is usually on the web portal of the email that one can also set these - without knowing your details I cannot advise you further - THAT SAID - I am NOT asking you to post the details on a public website - you may want to connect with your ISP or domain provider like I indicated This thread has been closed by the system or the community team. You may vote for any posts you find helpful, or search the Community for additional answers. Adding Domain Emails to VIP If you use an email provider like iCloud, Google, Microsoft Exchange, or Yahoo, Mail can automatically set up your email account with just your email address and password. Here's how: Go to Settings > Apps > Mail, then tap Mail Accounts. Tap Add Account, then select your email provider. Enter your email address and password. If you see Next, tap Next and wait for Mail to verify your account. If you see Save, tap Save. Learn which listed email provider matches your email account. If you need to set up your email account manually, make sure that you know the email settings for your account. If you don't know them, you can look them up or contact your email provider. Then follow these steps: Go to Settings > Apps > Mail, then tap Mail Accounts. Tap Add Account, tap Other, then tap Add Mail Account. Enter your name, email address, password, and a description for your account. Tap Next. Mail will try to find the email settings and finish your account setup. If Mail finds your email settings, tap Done to complete your account setup. If Mail can't find your email settings, then you need to enter them manually. Tap Next, then follow these steps: Choose IMAP or POP for your new account. If you aren't sure which one to choose, contact your email provider. Enter the information for Incoming Mail Server and Outgoing Mail Server. Then tap Next. If you don't have this information, contact your email provider. If your email settings are correct, tap Save to finish. If the email settings are incorrect, you'll be asked to edit them. Page content loaded Mar 2, 2017 8:35 PM in response to Ergolad Still works on all my devices (running a variety of OS (albeit antiquated)): El Cap v10.11.6 Mail v 9.3 (3124) iOS 8.3 iOS 9.3.5 iOS 7.1.2 Biggest pain is that of the 3 accounts I do this with I have one Hotmail/Outlook account that has such draconian SPAM filters, I may either have to retire that account, or look for another solution. There's no way to disable it entirely on the MS side and let iCloud deal with it, and just no good way in an iOS app (IMO) to deal with false positives if I went straight Exchange. All false positives need to be corrected or whitelisted on the Outlook.com site. Grrrrr. Oct 12, 2011 12:58 PM in response to Andreas Yankopolus same problem ... i think actually there's no way to keep own address for outgoing mails. at least if incoming and outgoing mail should use the same mailbox, the only way seems to set up another account for sending mails via your own imap-server and forwarding incoming mails to your icloud-account. or you consider to use gmail. google allows sending over own addresses ..... regards yawho Oct 12, 2011 3:42 PM in response to Andreas Yankopolus Is there any reasonable way to use it with iCloud? For what purpose? iCloud does nothing for external email accounts. It just provides you with a new IMAP & Push capable email account with an @me.com domain (if you want one). Oct 12, 2011 5:12 PM in response to Andreas Yankopolus I do this with Gmail and it works really well. Oct 13, 2011 2:46 AM in response to Topmounter Please tell us how did you manage this through Gmail. I did the same when I had my MobileMe account but can't find the options in iCloud! Thanks! Oct 13, 2011 1:51 PM in response to h.mook I think Topmounter ment he use Gmail only, no iCloud at all. There is no way to use iCloud with your own email domain. Apple don't want the professional users. Only private users are welcome. I guess. See: link Oct 14, 2011 12:08 PM in response to Andreas Yankopolus I was my own domain with mobileme, it sent and recieved from and external domain. Since moving to icloud it continues to receive mail from external server but will not send with that address, only the me.com address. Oct 16, 2011 5:17 PM in response to Sebastian Wolter Sebastian Wolter wrote: ... There is no way to use iCloud with your own email domain.... Actually not so - there IS a way to use iCloud email with your own email domain. You do it by using fastmail.fm's SMTP servers to send outbound mail via Mobile Me (and now iCloud) using your choice of domain name. I've been doing it before and since the migration to iCloud and it works perfectly. Basically, you pay a onetime (lifetime) fee to Fastmail to let you set up an account. They give you a special SMTP server that lets you use your choice of email address when sending, and then changes it to another. So now I use forwarding to send my inbound to icloud.com (using forwarding from my work domain) - that part's easy for anyone to do - then I reply from my me.com address but have my settings so that outbound mail uses Fastmail's SMTP server instead of Apple's. Since I'm registered with fastmail, the fastmail server sees the traffic and says basically: "If an email from ed\*\*\*@me.com asks to be sent, then send it as edsworkaddress@edsworkdomain.com." Sounds complicated but it isn't. A better and more through explanation is here: Oct 17, 2011 3:59 AM in response to edbern2 Please note that we are talking about iCloud, not MobileMe. Your way worked in MobileMe but no longer with iCloud. Oct 17, 2011 5:41 AM in response to Andreas Yankopolus iCloud doesn't do that. It's not a backup/sync service for external email accounts, and technically cannot be. Your existing email provider should provide that functionality for its own accounts. Oct 17, 2011 5:43 AM in response to Jaam91 That's correct. Using a "Send From" address to send from a non @me.com or @mac.com email address is not a feature of iCloud. Oct 17, 2011 8:05 AM in response to Julian Wright Julian Wright wrote: That's correct. Using a "Send From" address to send from a non @me.com or @mac.com email address is not a feature of iCloud. apologies -- but the weird thing is it DID work a few times. But I think I see why: The configuration for all this used to be to turn off the SMTP server for Mobile Me in advanced settings, and instead add, and then choose, the fastmail server for outbound. And the fastmail server is still in the list, but now you can't turn off iCloud as the primary SMTP. The iCloud SMTP switch is there, but it is slightly greyed out, and can't be moved. So my lucky successes must have worked when iCloud wouldn't send (which was happening a lot at first, when Apple servers were still funky, I suppose), so it went to the fastmail server as the next available. Does that make sense? Oct 19, 2011 6:52 AM in response to Andreas Yankopolus Hi, I have found away that I think may help you. Background as to why I use it. I have a @me.com address and Gmail but my contacts only know my Gmail account but I wanted to use cloud email so it would sync properly across all my devices, MBP, iPad and iPhone and also have the push email that the previous Mobile Me had and iCloud has now. So what I have done on my MBP is this. I use Mail. You need to go into system preferences and select iCloud... in here turn off Mail and Notes. Now open Mail and select preferences. Then select accounts. Delete all accounts there. Now set up a new account by pressing the + button. After that enter the details as if you were setting up to use your Me.com account and press CREATE. You now go to a page where you can edit all your mail settings manually. In the first section of the page you have: Account Type - This should say - iCloud IMAP/Description - This can be described by you to be anything Email Address - This is the email address you want people receiving the email to see Full Name - As it says up your name Incoming Mail Server - If you want the mails to come from iCloud then use: p99-impap.mail.me.com User Name: The user name of the icloudPassword: the password of icloud \*\*Note\*\* In this section you are putting in where you want the mails to come from. In this case I wanted the mails to come from iCloud so I forwarded all my mails from my Gmail account to my @me.com address, and then got iCloud to deliver them. Outgoing Mail Server: Now this is the interesting part. I have changed this to the GMAIL server on my Gmail account. I have done this as I want my mails saved also at my Gmail account so by routing them through Gmail this happens as well as recording the sent mails at iCloud. \*\*\*\*\* On iPhone and iPad you just add iCloud and then turn off mail again. Now you set up a mail account using the other option. 1. IMAP Account Information - In here I put the information that I want my contacts to see2. Incoming Mail Server - I put the iCloud information3. Outgoing Mail Server - I put the Gmail server \*\*\*\*\* So in short now, I get complete syncing of my mails across my 3 devices and have the extra back up of iCloud, but my clients do not see my @me.com (iCloud) email address, they see my Gmail address that I have been using for many years so there is no confusion for them. I really hope you get all of that, this is the first time I have helped on here so am very much a newbie but it seems to be working for me. James MBP - 2009 iPhone 4 - 2010 iPad 2 - 2011 Oct 19, 2011 5:54 PM in response to JamesR202 James Outstanding! This approach works perfectly. I was tracking toward this solution but you nailed down the details. I didn't see that you must turn off mail on the iPad otherwise to avoid having two (duplicate) accounts, although you will have a choice in this case of sending from either (1) your personal domain or (2) your @me.com domain. Some people might like that option. Thanks again. Rob iPad - 2011 MBA - 2010 MBP - 2009 Mac - Late 2006 G4 Cube - 2000 Page content loaded May 22, 2008 10:37 PM in response to io11 I dont know why you would want to delete the application only to reinstall it, but I think you could just trash it and then reinstall it from the installation DVD's that came with your mac. If you want to get deeper into it, you could install appzapper or cleanapp to remove it then reinstall from there. May 23, 2008 4:07 AM in response to io11 Why don't you try deleting the folder "/Library/Mail" and the file "/Library/Preferences/com.apple.mail.plist" first before taking more drastic steps? May 23, 2008 4:31 AM in response to io11 Mail is one of the applications you can re-install separately from your 10.5 disk. This is for 10.4 but the same is true for 10.5 Custom installs in Mac OS X 10.4. If you delete Users/Home/Library/Mail you will lose all your email. If you do delete Users/Home/Preferences/com.apple.mail.plist you will lose all your email account settings and general mail preferences. -mj May 23, 2008 6:04 AM in response to io11 My issue is similar to this, but... When I upgraded to Leopard, I could not get Mail to work. I deleted all the account info I had and reloaded it, but the two issues I ran into were: 1. Mail would only download one file, and then "hang". 2. You could not quit mail, you had to force quit so... I tried deleting both the mail preferences in the library, as well as the users/home/library preferences. Neither solved the issue. My issue with using time machine to back up everything was that because something there is corrupt, I did NOT want to back up a corrupt file. So what I did was I loaded Leopard to my external drive and booted from that. I then copied mail from that drive to my hard drive. While I was booting from the external, I set up mail, and everything worked perfectly! But when I booted from the hard drive, I still had the same issue. I again tried deleting both preference files. I tried launching Mail from the external. I tried copying the preferences from the external and pasting them to the hard drive Bottom line: If I boot from the external, everything works fine. If I boot from the hard drive, Mail hangs. So right now, my two choices are to always boot from my external (bad) to only using Thunderbird (worse). I'm quite open to suggestions. Absolute backup is to clear the hard drive and start over. I'm hoping for something easier than that first. So there must be a preferences file I'm missing somewhere. May 23, 2008 8:57 PM in response to io11 I actually reinstalled it using Pacifist from which works great. I also deleting the plist file but I still having the same problem. frustrating like \*\*\*\*. Basically, I just can't receive emails. it's just spinning forever but not receiving any emails. I got entourage working great but Mail not and I just prefer Mail. Jun 3, 2008 12:58 PM in response to io11 I Googled "apple reinstall mail" and stumbled upon this discussion. I am amazed that you are having the exact same problem I am having. Mail begins to download, and then it "hangs" on a message. It's a different message every time, though, so I know it's not an issue with one of the emails. By the way, the issue only happens for my Yahoo! email account. Gmail and .mac work just fine. (Oh, and web-based Yahoo! email works fine, too.) I'm curious: when did this start happening for you all? My issue began on 16 May. Haven't been able to get a message via Yahoo! since then. Jun 3, 2008 6:54 PM in response to tom.com I'm having the same problem with Mail, and it started last week. Hopefully someone will come up with a solution so we don't have to wipe our hard drives to use Mail. Jun 3, 2008 7:05 PM in response to punkvision UPDATE... I renamed the MAIL folder in the user Library and restarted Mail, and even though I lost all the old email it seems to work now. Jul 4, 2008 11:49 AM in response to punkvision I have been force quitting mail for months now - I've tried deleting plists, deleting mail accounts and all sort of various suggestions with no luck. I just tried renaming my MAIL folder and it worked - my mail now quits. I only lost my Rules and RSS feeds but I can live with that. I'm so pleased. Many thanks Page content loaded Jun 4, 2014 11:30 AM in response to TanyaH1234 Hey TanyaH1234, Thanks for the question. You can use our handy Mail Settings Lookup tool to help setup your email account: Mail Settings Lookup - Apple Support Matt M. Oct 23, 2014 2:28 PM in response to TanyaH1234 Incoming pop3.mweb.netmail address password Outgoing smtpauth.mweb.co.za email password Go to advanced tick password and turn off ssiport 25 Will work now Rollins Duke (duplicate): Published: June 24th, 2024 \* 3 Min Read To configure a Mweb Webmail account in another email client, we must first understand the IMAP, SMTP, and POP3 settings. If you're looking for Mweb Webmail Settings, you can learn everything you need to know about configuring Mweb Email settings and backing up your Mweb Email account in this blog. In order for you to configure your Mweb webmail account in any other email clients like Outlook, Thunderbird, Apple Mail, or mobile devices like Android, iPhone, etc. Moreover, make a backup copy of your Mweb email account's emails or migrate them to another email client and file format. If you have any more questions or issues, please Contact us directly. Mweb E-mail Settings Port Number Incoming mail server for Mweb IMAP: imap.mweb.net 993 (require SSL) 143 (non-secure) Incoming mail server for Mweb POP3: pop.mweb.net 995 (require SSL) 110 (non-secure) Outgoing mail server for Mweb SMTP: smtp.mweb.net 465 (require SSL) 587 (non-secure) Mweb.co.za Email Settings Port Numbers Incoming mail server for Mweb.co.za: imap.mweb.co.za 143 (require SSL) 993 (non-secure) Incoming mail server for Mweb.co.za POP3: pop.mweb.co.za 995 (require SSL) 110 (non-secure) Outgoing mail server for Mweb.co.za SMTP: smtp.mweb.co.za 587 (require SSL) 465 (non-secure) If you want to convert all of your Mweb emails into another email application, such as Windows Live Mail, Lotus Notes, Zimbra, Thunderbird, ZIP, Gmail, Outlook.com, Yahoo, Rediffmail, Office 365, Exchange Server, Hosted Exchange Server, G Suite, IBM Verse, Amazon WorkMail, iCloud, iWork, IMAP, or any other suitable file format, such as PST, MSG, EML, EMLX, MBOX, PDF, HTML, MHT, XPS, RTF, DOC, CSV. You may then use our Email Backup Software. Just use the "Download Now" button to download and install the program from: You may find all the Mweb backup instructions in the aforementioned video lesson. The procedure is really straightforward and easy. From our website, you may get the trial version. Only 25 emails may be converted per folder in the Demo version. Additionally, it allows batch conversion. Mweb Backup Software is, in a nutshell, a fantastic option for all users. It delivers output that is entirely accurate. It is a virus-free solution, as well. So, feel free to give it a go. Also Get Solution to Add MWEB Email to Outlook 2019, 2016 By Hosam El-Aker I John Foxx/Stockbyte/Getty Images MWEB is a South Africa-based Web services provider. Founded in 1997, MWEB provides Internet access, hosting, email and other services. MWEB provides service for both homes and businesses, and serves 320,000 South Africans. MWEB allows you to use either an address provided by the company to log into and use its services, or to create and use any email address you want. You can create your own email address, using a private domain or a free-email provider, to use with your MWEB account. Navigate to the MWEB homepage (see Resources) and click "Email." Click "Click Here to Register." Enter the email address you want to use to create your MWEB account in the "E-mail Address" field. Click "Submit." A "thank you" message appears telling you to log into the email address you used to activate your account. Log into the email account you used in the previous step. Find the email from "Email protected" and click the "Complete Registration" link to complete the MWEB email-account-creation process.
