When using this software, please refrain from other Android control software. Otherwise, this software will not work properly, which may affect the recovery process and result. Step 3: This is not an inevitable step. This following interface will appear when you connect your Android phone to PC for the first time, or you have not always checked this PC option even if you are not connecting for the first time. In this situation, if you are lucky, you can press OK on your broken phone and then move on to the next step. Step 4: If you do not need to enable USB debugging, you will proceed to this step immediately after the scanning process. Here, this interface provides two types of scan options: quick scan and deep scan. If you choose a quick scan, only lost or deleted contacts, short messages, and call records will be recovered, and this scanning process won't take long. If you choose deep scan, the software will scan your entire device and restore all types of data mentioned in this interface by default, and this scanning method will take a long time. Select the scan method you want to use and click the blue button in the bottom right corner to continue. Let's take a deep analysis here as an example. Step 5: Then you will see the scan results interface. The scanned data types will be listed on the left, allowing you to select the data and files you want to recover by type. For example, if you want to get photos from a broken Android phone, you can choose from three types: camera, app photo of the photo and video category, and raw image and image of the document category. Then just select the photos you want to recover and click "Recover" to continue. In the scan results interface, you can see the deleted and existing data and files that will be displayed in this scan results interface. This means that if you're lucky, you'll even find deleted items whose filenames are in Orange.
